NSRP RA Project 2017-443 “Ship Structural Design Optimization (SSDO) for Improved Producibility and Enhanced Life-Cycle Performance”

SDMT Panel Briefing
October 29, 2020

DISTRIBUTION STATEMENT: Unlimited/Approved for Public Release

Rationale – Why Develop Multi-Objective Structural Design Space Exploration for Early-Stage Design

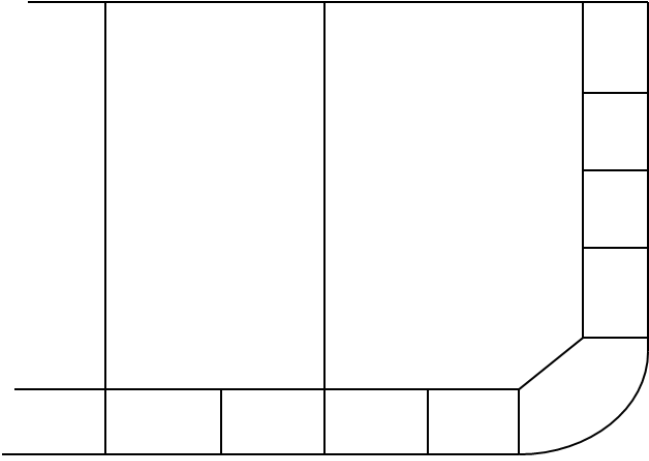

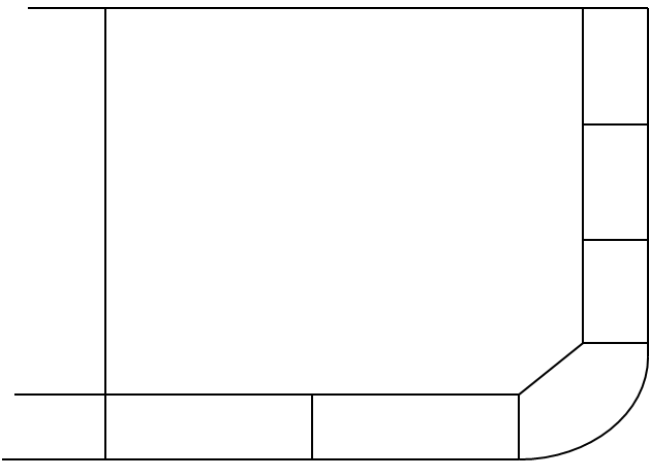

- **Traditional Approaches** – structural design has relied on least weight approaches, correlating with weight-based cost methods, and static design methods in early stage design
- **Resulting Structural Shortcomings** – Lightweight structures that are more complex with higher work content to fabricate, and lack robust qualities causing high in-service damage and repair costs from extreme loads and structural fatigue damage
- **Structural Design Space Exploration** – using automated 3D finite element analysis and higher-fidelity loading in early-design enables design alternatives to be engineered and compared for work content and performance through the life cycle
- **Structural Optimization** – which implements Lean Design principles offers practical tools for effective design space exploration

Lightweight structures lead to high Total Ownership Costs (TOC)

DISTRIBUTION STATEMENT: Unlimited/Approved for Public Release

Structural Work Content

 <p>CL Girder P/S Bhd</p> <p>Traditional Design 2 long. bulkheads, 9 IB girders, 4 horizontal stringers, and 5 web frames per 12 M tank</p>	 <p>CL Bhd</p> <p>Lean Design 1 long. bulkheads, 5 IB girders, 3 horizontal stringers, and 3 web frames per 12 M tank</p>
<p>>50% reduction in structural work scope, >35% reduction in tank coating surface, and improved tank access with ~3% increase in steel weight.</p>	

Reduced work content & improved tank access

Ship Structural Design Optimization (SSDO) Program Team

- **Fincantieri Marinette Marine**
 - Project Lead, shipyard implementation
- **MAESTRO Marine LLC**
 - Naval architects & software developers, creators of MAESTRO
- **NSWC-CD Code 65**
 - US Navy lead organization for ship structural design
- **Ship Design USA (Bob Keane)**
 - Former US Navy Chief Naval Architect, advisor on Navy ship design & construction
- **SPAR Associates**
 - SMEs in ship cost-estimating and production planning
- **P. Jaquith & Associates (Pete Jaquith)**
 - SME in Lean Design and Design for Production

SSDO Provides Higher Fidelity Ship Structural Engineering from Concept Design through the Full Life-Cycle

APPLICATION OF MAESTRO OPTIMIZATION & ANALYSIS

Topology Optimization
Coarse global FEA model

Static Global Loading:

- Automated optimization
- Design space exploration
- Topology search process

Full matrix

Selected Topology Opt.
Fine mesh midbody model

Loading:

- Secondary & tertiary loads
- Basic hydrodynamic loads
- Extreme Load Analysis
- Spectral Fatigue Analysis
- Life-cycle cost factors

Selected Candidates

Full Optimization
Finer mesh global model

Loading:

- Secondary & tertiary loads
- Full hydrodynamic loads
- Extreme Load Analysis
- Spectral Fatigue Analysis
- Higher fidelity life-cycle cost factors

Final Topology

In-Service Engineering
Fine mesh model & class database

Loading:

- Operational loads
- Extreme loads
- Spectral fatigue
- Damage conditions

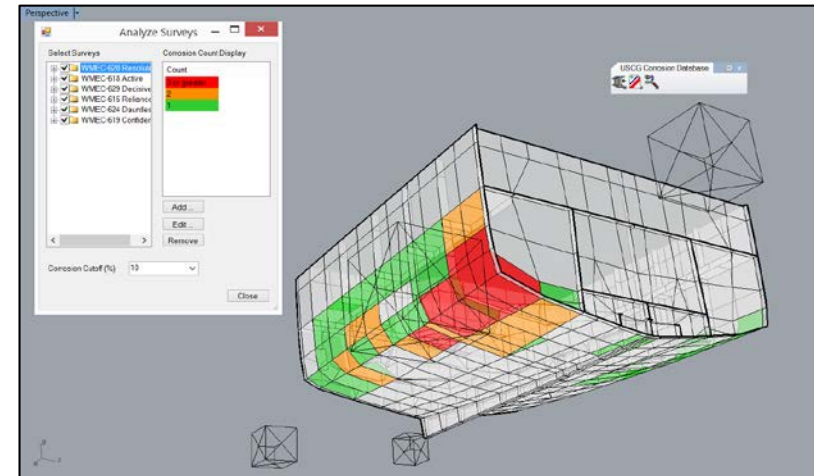

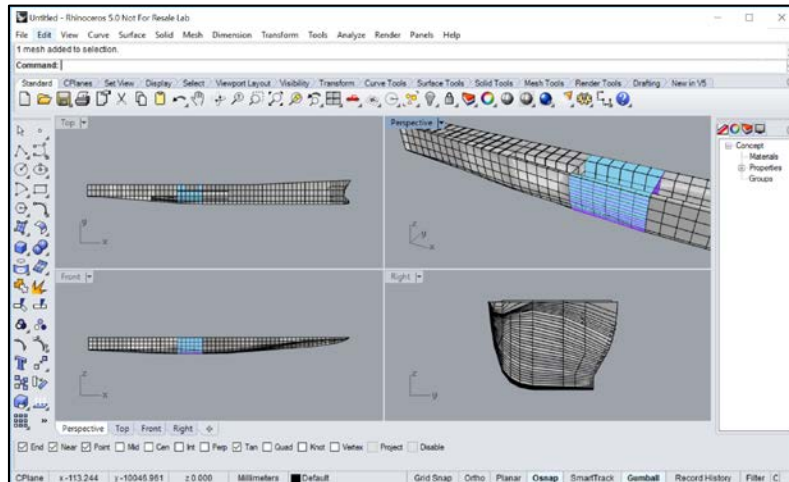

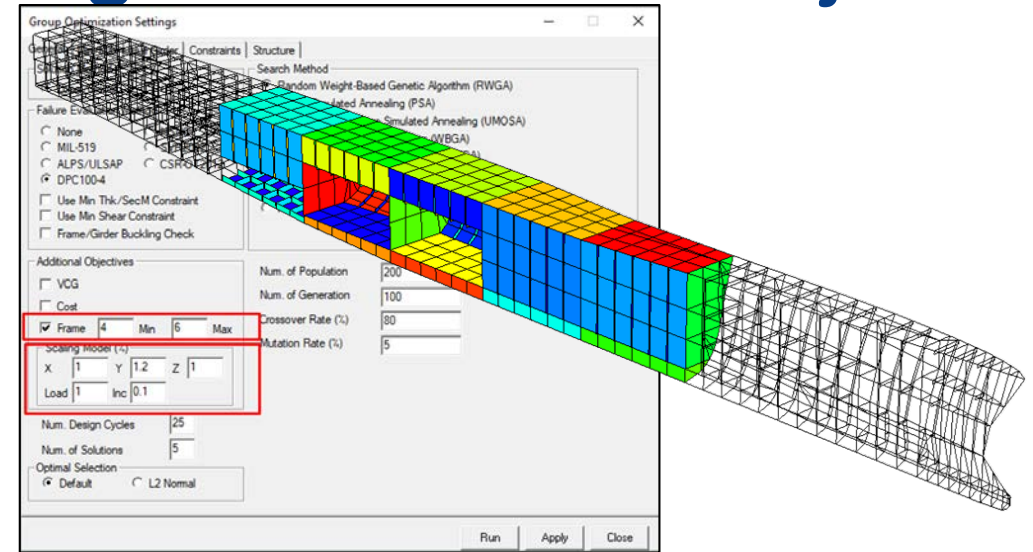

Corrosion database

DISTRIBUTION STATEMENT: Unlimited/Approved for Public Release

SSDO Improvements Delivered Through the NSRP RA Project

- Concept Design/Topology Optimization Module
- Cost & Production Engineering Module
- Life-Cycle/Corrosion Module

Concept Design/Topology Optimization Module: Design Space Exploration Approach

- We have successfully developed a capability to conduct an optimization of a coarse mesh MAESTRO finite element model that automatically varies frame spacing and then, for each frame spacing, varies the global stiffener spacing with user defined min/max values.
 - For example, 3 frame spacings x 4 stiffener spacings = 12 optimized designs are automatically generated
- The capability was extended to enable the finite element analysis based automated optimization of structures that have the hull principal dimensions changed
 - Length, breadth, depth can be scaled automatically

Design Space Exploration & Structural Optimization

Optimization Settings Interface

USN safety criteria

Vary frame spacing

Scale global hull

Vary stiffener spacing

Group Optimization Settings

General | Min/Max | Hull Girder | Constraints | Structure

Solution Method
☒ Local/Global ☐ Global

Failure Evaluation Method
☐ None ☐ HSNL
☐ MIL-519 ☐ SVR2002

	Variable	Min(in)	Max(in)	Increment(in)
Plate	Thickness			
Beam	Spacing	20	40	5
	Number			
	Web Height			
	Web Thickness			
	Flange Width			
	Flange Thickness			

Coarse mesh mid-body
Finite element model

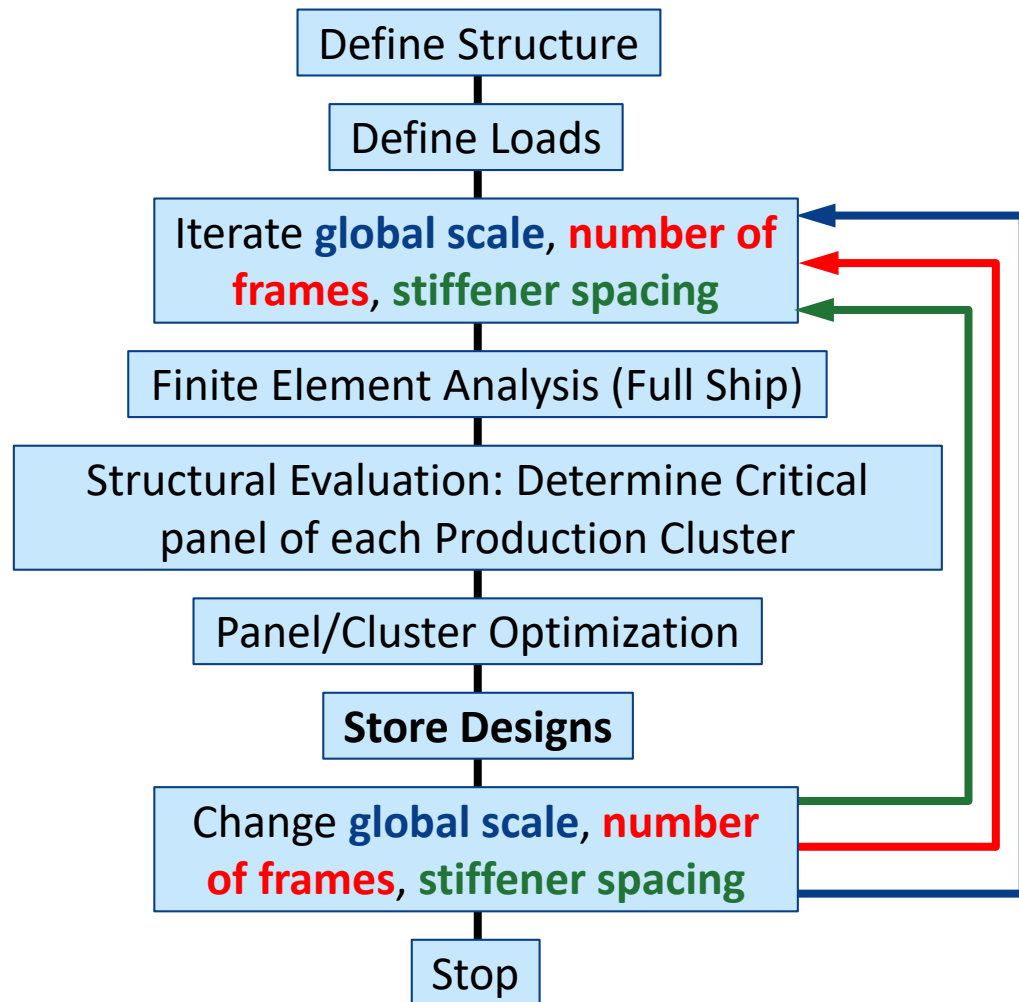

Original Optimization Process

- Process implements “Six Stages of Rational Ship Structural Design” as published by Professor Owen Hughes
- Uses mid-body or full ship finite element modeling and analysis with high fidelity naval architectural loading
- Automates structural failure or limit-state evaluations which serve as constraints for optimization
- Optimizes “manufacturing or design clusters” (inner loop)
- Then re-integrates revised full structure to update structural performance evaluation vs criteria

New Topology SSDO Process

- Additional nested global iterations are added to optimize changes of:
 - **Stiffener spacing**
 - **Number of frames**
 - **Global scale/dimensions (length, beam, depth of hull)**
- Automatically generates modified finite element models to support the geometry changes
- Optimizations automatically iterate to convergence
- Each optimized structural design is saved and has metrics extracted for review

Example Optimization Results

Stiffener and Frame Iterations

Topology Optimization Level 1 global FEA

Static Global Loading:

- Automated optimization
- Design space exploration
- Topology search process

Design

Example Optimization Results, with Hull Size Changes

- This example iterates all three:
 - **Stiffener spacing**
 - **Number of frames**
 - **Global scale/dimensions; this case also changes depth of hull**
- Ship arrangement alternatives
- Production schedule and cost impacts
- Impact SWBS Group 100 as well as other SWBS Group production and cost factors

Cost & Production Engineering Module

- A new MAESTRO software module has been designed to be used by **shipyard cost and production engineers**, not the structural naval architect, for defining cost and production data associated with the structural design and fabrication processes.
 - Specify the plates and shapes in the yard's "**structural warehouse**"
 - Define **structural fabrication processes**, e.g. panel lines and their cost metrics
 - Define the **structural fabrication components** and sequence of assembly
 - **Review results/metrics** for optimized structural alternative designs

Data from this module will be used in SSDO's work content optimization to facilitate **realistic reductions/trade studies in work content and producibility enhancements**

DISTRIBUTION STATEMENT: Unlimited/Approved for Public Release

US Coast Guard SFLC Sponsored Corrosion Database Toolset Adaptation to SSDO Life-Cycle Assessment Objectives

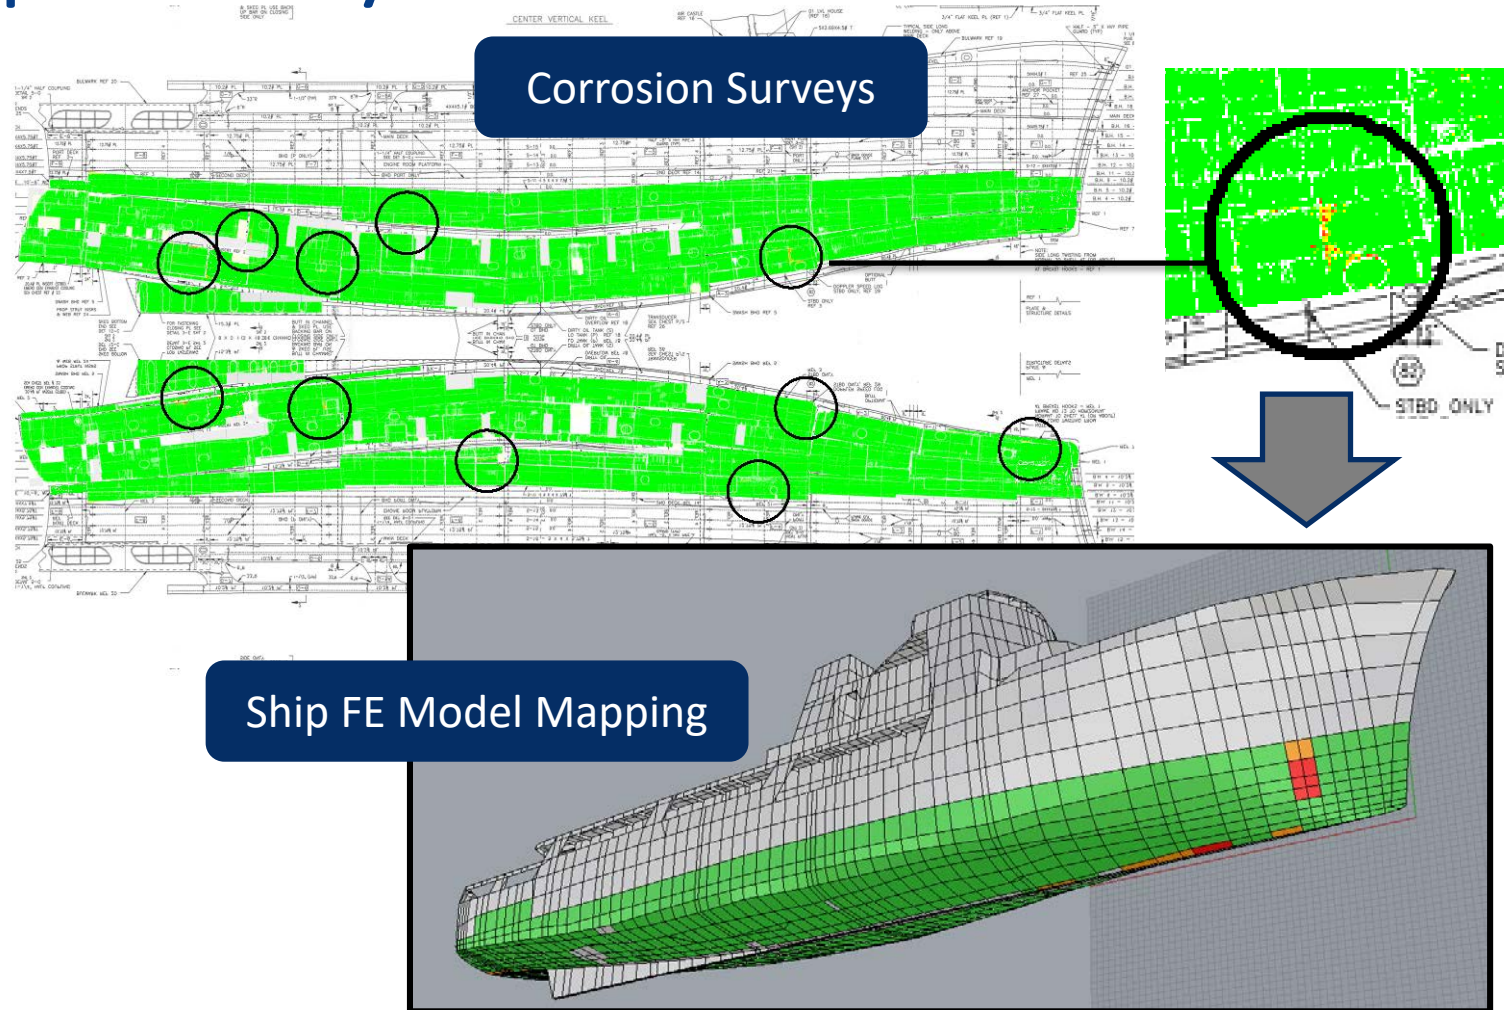

- Track corrosion and other damage to a vessel's structure in a Rhino plug-in and database
- Collect, organize, and display data spatially, temporally, and across the fleet
 - Spatially: data displayed on 3D model
 - Temporally: display progression of corrosion/damage over multiple surveys
 - Fleet: examine data across vessels of a class
- Plan future surveys and repairs
- Support structural analysis of the vessel in its corroded/damaged condition
 - Structural Response (yielding/buckling)
 - Hydrodynamic Loads Analysis (MAESTRO-Wave)
 - Extreme Load Analysis (ELA)
 - Spectral Fatigue Analysis (SFA)

Corrosion Database Tool

Conduct Life-Cycle Impact Analyses and Trade Studies

- Corrosion surveys mapped into database that correlates with ship finite element (FE) model
- Corroded/damaged conditions are automatically transferred to ship FE model for analysis
- Support in-service engineering
 - Structural integrity evaluation
 - Fatigue life forecasting
 - Structural margins assessment
 - Structural repair management
 - Damage condition assessment

NSRP RA Project 2017-443 Summary

“Ship Structural Design Optimization (SSDO) for Improved Producibility and Enhanced Life-Cycle Performance”

- Early-stage design can rapidly engineer and assess the effects of global changes to frame spacing, stiffener spacing, as well as for changes to hull dimensions
- Production & Cost Engineering have the ability to impact the ship's structural design while it can still be changed during design to optimize cost, weight and production
- Life-cycle factors such as extreme load capabilities, structural fatigue life, and damage tolerance can be engineered during design to effectively improve the life-cycle performance and reduce excessive in-service structural repair costs
- In-Service Engineering can leverage the final design model throughout the ship's life to reduce life-cycle costs, engineer structural repairs, assess damage conditions, and ensure ship structural integrity with minimum downtime and repair costs
